### Problem

Let  $X_1, \dots, X_n \stackrel{iid}{\sim} f(x|\theta) = \theta x^{-2} I(x \geq \theta)$ , where  $\theta > 0$ . Consider testing

$H_0: \theta \leq \theta_0$  vs.  $H_1: \theta > \theta_0$  for some known value  $\theta_0$ .

(a) Derive the LR test with size  $\alpha$ .

(b) Derive the power function.

(c) Using R, draw a figure of the power function under  $\alpha = 0.05$  with 3 different values of  $n$ . (Combine 3 curves in one figure). Explain how the changes under different values of  $n$ .

### Solution:

$X_1, \dots, X_n \stackrel{iid}{\sim} f(x|\theta) = \theta x^{-2} I(x \geq \theta) \quad \theta > 0$

To test  $H_0: \theta \leq \theta_0$  v.s.  $H_1: \theta > \theta_0$

$$\mathbb{H} = \{\theta | 0 < \theta < \infty\}$$

$$\mathbb{H}_0 = \{\theta | 0 < \theta \leq \theta_0\}$$

(a)&(b)

$$L(\theta|x) = f(x|\theta) = \prod_{i=1}^n \frac{\theta}{x_i^2} I(x_i \geq \theta) = \frac{\theta^n}{\prod_{i=1}^n x_i^2} I(x_{(1)} \geq \theta)$$

$\therefore L(\theta|x)$  is increasing in  $\theta \in (0, x_{(1)})$

$\therefore \hat{\theta} = x_{(1)}$  is the mle of  $\theta$ .

$$\Rightarrow \sup_{\theta \in \mathbb{H}} L(\theta|x) = \frac{[x_{(1)}]^2}{\prod_{i=1}^n x_i^2}$$

$$\sup_{\theta \in \mathbb{H}_0} L(\theta|x) = \begin{cases} \frac{[x_{(1)}]^2}{\prod_{i=1}^n x_i^2}, & \text{if } x_{(1)} \leq \theta_0 \\ \frac{[\theta_0]^2}{\prod_{i=1}^n x_i^2}, & \text{if } x_{(1)} > \theta_0 \end{cases}$$

$$\therefore \lambda(\mathbf{x}) = \frac{\sup_{\theta \in \mathbb{H}0} L(\theta | \mathbf{x})}{\sup_{\theta \in \mathbb{H}} L(\theta | \mathbf{x})} = \begin{cases} 1, & \text{if } x_{(1)} \leq \theta_0 \\ (\frac{\theta_0}{x_{(1)}})^n, & \text{if } x_{(1)} > \theta_0 \end{cases}$$

We reject  $H_0$  if  $\lambda(\mathbf{x}) < c$ , where  $c$  is a constant with  $0 \leq c < 1$

$$\Leftrightarrow (\frac{\theta_0}{x_{(1)}})^n < c \text{ if } x_{(1)} > \theta_0 \Leftrightarrow x_{(1)} > \theta_0 c^{\frac{-1}{n}} > \theta_0$$

$\therefore \mathbf{R} = \{\mathbf{x}: x_{(1)} > \theta_0 c^{\frac{-1}{n}}\}$  is the rejection region.

$$\begin{aligned} \beta(\theta) &= P_\theta(\text{reject } H_0), \theta \in \mathbb{H} \\ &= P_\theta\left(x_{(1)} > \theta_0 c^{\frac{-1}{n}}\right) = \left[P_\theta\left(x_1 > \theta_0 c^{\frac{-1}{n}}\right)\right]^n \\ &= \left(\int_{\theta_0 c^{\frac{-1}{n}}}^{\infty} \theta x^{-2} I(x \geq \theta) dx\right)^n \\ &= \begin{cases} \left(\int_{\theta_0 c^{\frac{-1}{n}}}^{\infty} \theta x^{-2} dx\right)^n, & \text{if } \theta \leq \theta_0 c^{\frac{-1}{n}} \\ \left(\int_{\theta}^{\infty} \theta x^{-2} dx\right)^n, & \text{if } \theta > \theta_0 c^{\frac{-1}{n}} \end{cases} \\ &= \begin{cases} (\frac{\theta}{\theta_0})^n c, & \text{if } \theta \leq c^{\frac{-1}{n}} \theta_0 \\ 1, & \text{if } \theta > c^{\frac{-1}{n}} \theta_0 \end{cases} \end{aligned}$$

$$\Rightarrow \beta(\theta) = \begin{cases} (\frac{\theta}{\theta_0})^n c, & \text{if } \theta \leq c^{\frac{-1}{n}} \theta_0 \\ 1, & \text{if } \theta > c^{\frac{-1}{n}} \theta_0 \end{cases} \text{ is the power function of } \theta.$$

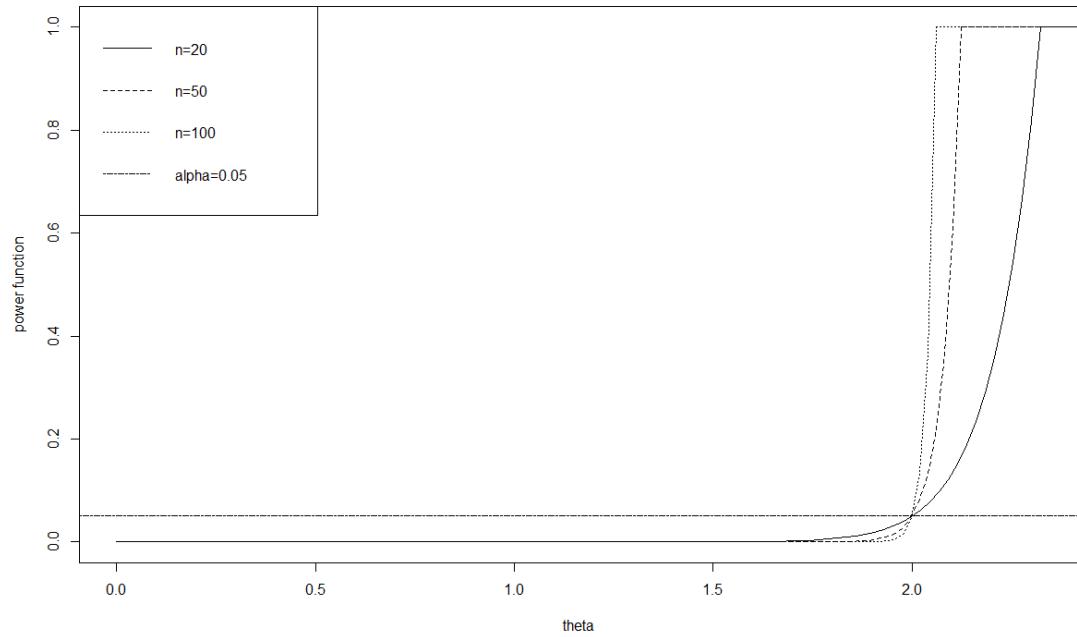

$$\therefore \alpha = \sup_{\theta \in \mathbb{H}0} \beta(\theta) = \sup_{0 < \theta \leq \theta_0} (\frac{\theta}{\theta_0})^n c = c$$

Hence  $\mathbf{R} = \{\mathbf{x}: x_{(1)} > \theta_0 c^{\frac{-1}{n}}\}$  is the LR-test with size  $\alpha$ .

(c)

$$\alpha = 0.05 = c$$

We set  $\theta_0 = 2$   $n = 20, 50, 100$  respectively

Apparently, the power is faster to reach the climax=1.0 as  $n$  is larger.

We could conclude that the power function is more powerful as  $n$  is larger.
